1. General Description

The EK-G76SXB integrates ARM Coretex®-M4 MCU with LoRa™ modulation that provides ultra-long range spread spectrum communication and high interference immunity whilst minimizing current consumption.

EK-G76SXB can achieve a sensitivity of over -136 dBm. The high sensitivity combined with the integrated +20 dBm power amplifier yields industry leading link budget making it optimal for any low data rate application requiring range or robustness. LoRa™ also provides significant advantages in both blocking and selectivity over conventional modulation techniques, solving the traditional design compromise between range, interference immunity and energy consumption.

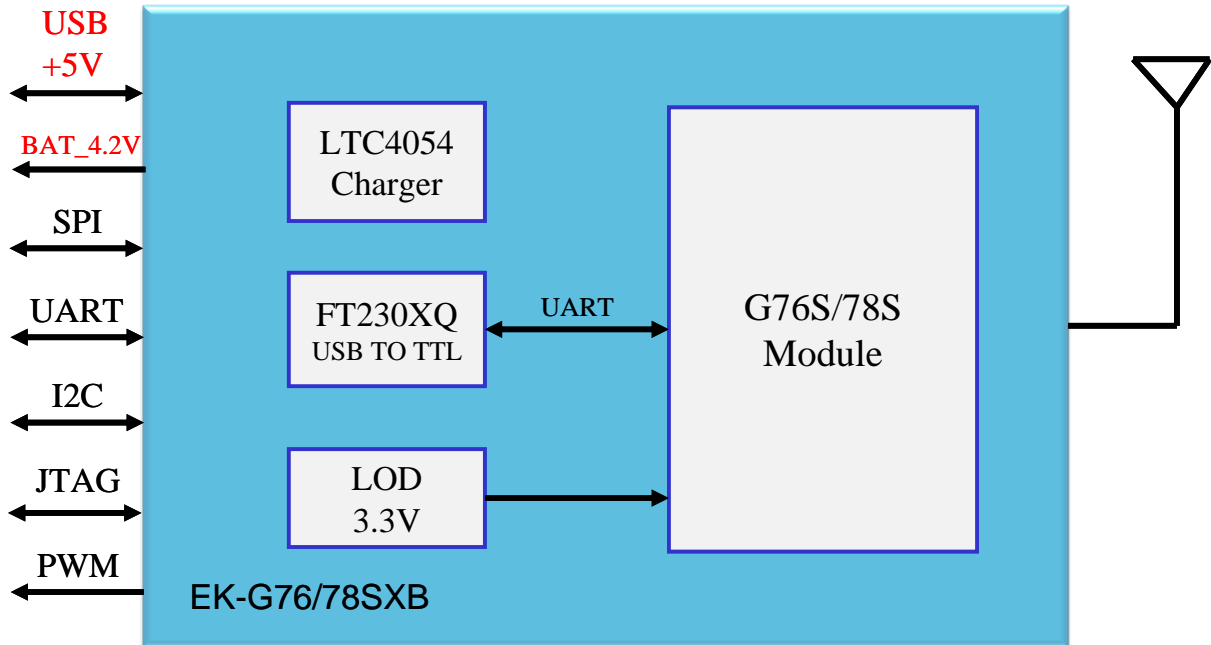

Feature

- Dimension : 47.94 mm x 24.38 mm
- LoRa™ Modem
- +20 dBm constant RF output vs. V supply
- Programmable bit rate up to 37500 bps
- High sensitivity: down to -136dBm
- Excellent blocking immunity
- Preamble detection
- Automatic RF Sense and CAD with ultra-fast AFC
- Payload up to 128 bytes with CRC

3. Control Protocol

<This chapter describes the behavior of factory default firmware. For customized firmware, this chapter is not applicable.>

3-1 LoRa™ Packet Brief

The LoRa™ Packet comprises three elements:

- A Preamble

The preamble is used to synchronize receiver with the incoming data flow. The preamble length is variable from 6 to 65535 symbols. By default it is configured with 12 symbols.
- Header

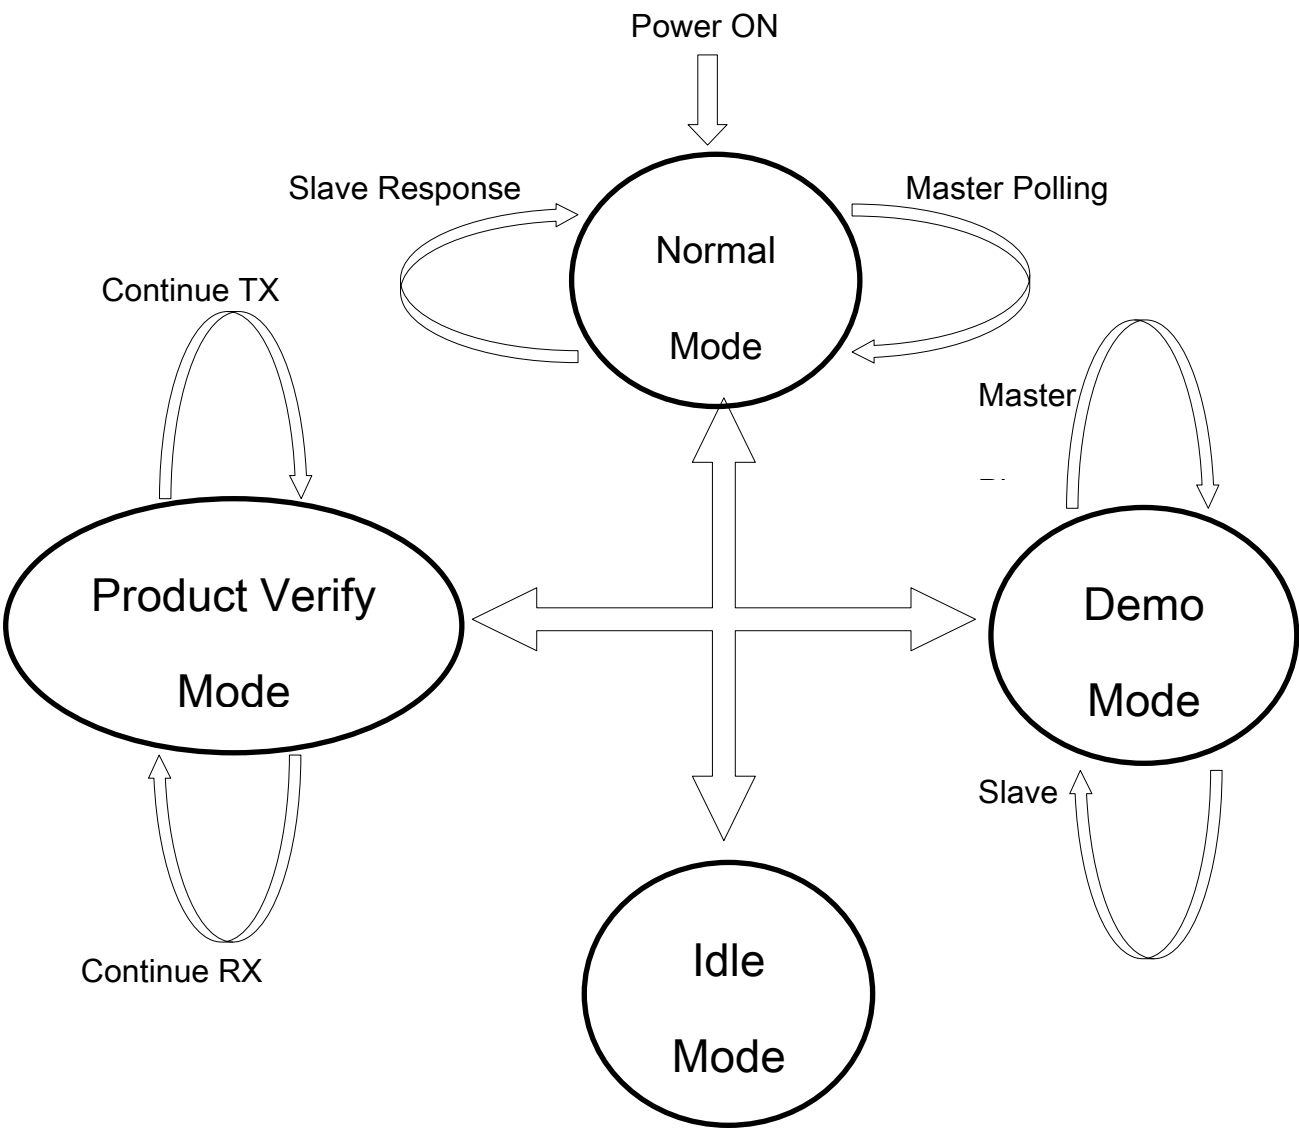

The header provides information on the payload, including length, FEC code rate, and the presence of CRC for payload.
- The data payload

The maximum length of payload is 128 bytes.

In order to meet regulation in different regions / countries, the FHSS (Frequency Hopping Spread Spectrum) maybe needs to be implemented also. That needs to control the transmission time on air within specific time. The transmission time could be calculated by [LoRa Calculator](#), which is downloaded on [Semtech Web Site](#).
